Landscape Erosion and Evolution Modeling Russell S. Harmon, William W. Doe III, 2012-12-06
Landscapes are characterized by a wide variation both spatially and temporally of tolerance and response to natural processes and anthropogenic stress. These tolerances and responses can be analyzed through individual landscape parameters such as soils, vegetation, water, etc. or holistically through ecosystem or watershed studies. However, such approaches are both time consuming and costly. Soil erosion and landscape evolution modeling provide a simulation environment in which both the short and long term consequences of land use activities and alternative land use strategies can be compared and evaluated. Such models provide the foundation for the development of land management decision support systems. *Landscape Erosion and Evolution Modeling* is a state of the art interdisciplinary volume addressing the broad theme of soil erosion and landscape evolution modeling from different philosophical and technical approaches ranging from those developed from considerations of first principle soil water physics and mechanics to those developed empirically according to sets of behavioral or empirical rules deriving from field observations and measurements. The validation and calibration of models through field studies is also included. This volume will be essential reading for researchers in earth environmental and ecosystem sciences, hydrology, civil engineering, forestry, soil science, agriculture and climate change studies. In addition, it will have direct relevance to the public and private land management communities. *The Indian Rivers* Dhruv Sen Singh, 2017-12-30
The book presents geomorphological studies of the major river basins, the Indus, Ganga and Brahmaputra and their tributaries. Besides major basins, the book explores peninsular rivers and other rivers state by state. All types of rivers, i.e. snow fed, rain fed and groundwater fed rivers are explained together in a geological framework. Rivers are lifelines and understanding of the rivers, their dynamics, science and socio-economic aspect is very important. However, different sources provide different data bases for rivers. But a book which explains all major rivers of a country at a single place was not yet available. This book is the first book of its kind in the world which provides expert opinion on all major rivers of a country like India. This book complements works in these areas for the last two to three decades on major rivers of India by eminent professors and scientists from different universities, IITs and Indian research institutions. The information presented in the book would appeal to a wider readership from students, teachers to researchers and planners engaged in developmental work and also to common people of the society concerned with awareness about rivers. **Rapid Visual Screening of Buildings for Potential Seismic Hazards: Supporting Documentation**, 2015

They further act as antagonists and play a pivotal role in neutralising soil borne plant pathogens and thus help in the bio control of diseases Application of biofertilizers instead of synthetic fertilizers could be a promising technique to raise agricultural productivity without degrading environmental quality The present book focuses on the latest research approaches and updates from the microbiota and their applications in the agriculture industry We believe this book addresses various challenges and shed lights on the possible future of the sustainable agricultural system
