Wood Properties and Processing Miha Humar,2020-05-23 Wood based materials are CO2 neutral renewable and considered to be environmentally friendly The huge variety of wood species and wood based composites allows a wide scope of creative and esthetic alternatives to materials with higher environmental impacts during production use and disposal Quality of wood is influenced by the genetic and environmental factors One of the emerging uses of wood are building and construction applications Modern building and construction practices would not be possible without use of wood or wood based composites The use of composites enables using wood of lower quality for the production of materials with engineered properties for specific target applications Even more the utilization of such reinforcing particles as carbon nanotubes and nanocellulose enables development of a new generation of composites with even better properties The positive aspect of decomposability of waste wood can turn into the opposite when wood or wood based materials are exposed to weathering moisture oscillations different discolorations and degrading organisms Protective measures are therefore unavoidable for many outdoor

applications Resistance of wood against different aging factors is always a combined effect of toxic or inhibiting ingredients on the one hand and of structural anatomical or chemical ways of excluding moisture on the other

Abiotic Stress-Mediated Sensing and Signaling in Plants: An Omics Perspective Sajad Majeed Zargar, Mohammad Yousuf Zargar, 2018-02-20 The natural environment for plants is composed of a complex set of abiotic and biotic stresses plant responses to these stresses are equally complex Systems biology allows us to identify regulatory hubs in complex networks It also examines the molecular parts transcripts proteins and metabolites of an organism and attempts to combine them into functional networks or models that effectively describe and predict the dynamic activities of that organism in different environments This book focuses on research advances regarding plant responses to abiotic stresses from the physiological level to the molecular level It highlights new insights gained from the integration of omics datasets and identifies remaining gaps in our knowledge outlining additional focus areas for future crop improvement research Plants have evolved a wide range of mechanisms for coping with various abiotic stresses In many crop plants the molecular mechanisms involved in a single type of stress tolerance have since been identified however in order to arrive at a holistic understanding of major and common events concerning abiotic stresses the signaling pathways involved must also be elucidated To date several molecules like transcription factors and kinases have been identified as promising candidates that are involved in crosstalk between stress signalling pathways However there is a need to better understand the tolerance mechanisms for different abiotic stresses by thoroughly grasping the signalling and sensing mechanisms involved Accordingly this book covers a range of topics including the impacts of different abiotic stresses on plants the molecular mechanisms leading to tolerance for different abiotic stresses signaling cascades revealing cross talk among various abiotic stresses and elucidation of major candidate molecules that may provide abiotic stress tolerance in plants
